Railsinstaller for OSX/WIN (Yes Win) @railsinstaller

As per previous post I was about to take the long journey to do a rails installation when RVM recommends railsinstaller. Installing everything you need for rails isn't really a pain, or hard, it's just tedious.

Click the download button on the stack you want. It's awesome that the Win Stack supports MS-SQL Server, I'll test that out… one day. Right now Downloading the OSX 10.7/10.8 Stack.

42 minutes and 337MB later, just click to run and it starts like an MSI windows installer. It asks for your github info (prob just to set up your —global email) and starts copying files.

15 minutes later it appears everything is installed and a quick $rvm list everything is indeed working as expected.

Installing RVM on OSX Mountain Lion Server

I don't really know why but while the world seems to be pointing me to rbenv I'm quite happy with rvm. I like how rvm abstracts gemsets away from the app. I'm one of those programming minimalists that doesn't like a lot of code in my code. So anyway I do this all the time, setting up rvm, and I always say to myself, "I'm pretty sure I already posted about this" and then I'm wrong so here goes.

1. Two Pounds of.. oh wait that's my grocery list.

Firstly head over to rvm.io because it has all the info there and wait what is this railsinstaller, oh scrap all that I'm trying this.
